; Sequence 5, Application US/08466662B
; Patent No. 613063
; GEKERAL INFORMATION:
; APPLICANT: Covacci, Antonello
; APPLICANT: Bugnoli, Massimo
; APPLICANT: Telford, John
; APPLICANT: Rappuoli, Rino
; TTLE OF INVENTION: Helicobacter Pylori Proteins Useful For Vaccines And
; TITLE OF INVENTION: Diagnostics
; TITLE PREFERENCE: CHIROD57
; CURRENT APPLICATION NUMBER: US/08/466,662B
; CURRENT FILING DAFE: 1995-06-06
; NUMBER OF SEQ ID NOS: 8

A) Accession: 873894
A) Status: preliminary; nucleic acid sequence not shown; translation not shown
A) Molecule type: DNA
A) Molecule type: DNA
A) Residues: 1-346 AHIMA
A) Recidues: 1-346 AHIMA
A) Cross-references: EMBL: AE000056; GB: U00089; NID: 91674263; PIDN: AAB96216.1; PID: 9167
A) Note: the nucleotide sequence was submitted to the EMBL Data Library, November 1996
C) Genetics:
A) Genetic code: SGC3
A) Genetic code: SGC3
C) Superfamily: tryptophan--tRNA ligase
C) Reywords: aminoacyl-tRNA synthetase; ligase; protein blosynthesis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     C; Species: Mycoplasmid pneumoniae
A; Variety: ATC 2942
C; Date: 27-Feb-1997 #sequence_revision 25-Apr-1997 #text_change 07-Dec-1999

A; Description: catalyzes the ATP-dependent carboxylation of acetyl-CoA to malonyl-CoA A; Pathway: fatty acid biosynthesis
A; Pathway: fatty acid biosynthesis
A; Note: biotin cofactor
C; Superfamily: human acetyl-CoA carboxylase; biotin carboxylase homology; lipoyl/biot C; Keywords: ligase
F; 127-199/Domain: lipoyl/biotin-binding homology < LPB>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A, Description: catalyzes the ATP-dependent carboxylation of acetyl-CoA to malonyl-CoA C, Superfamily: human acetyl-CoA carboxylase; biotin carboxylase homology; lipoyl/biot C, Keywords: ligase F;68-140/Domain: lipoyl/biotin-binding homology CLBB>

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            -1- SUBCELLULAR LOCATION: MITOCHONDRIAL MATRIX.
-1- DISEASE: DEFECTE IN PDX1 ARE A CAUGE OF LACTICACIDEMIA.
-1- SIMILARITY: BELONGS TO THE 2-OXOACID DEHYDROGENASE FAMILY.
-1- SIMILARITY: COUNTAINS 1 LIPOXL-BINDING DOMAIN
                                                                                                                                                                                                                                                                                         DEHYDROGENASE COMPLEX) (E3-BINDING PROTEIN) (E3BP) (PROX).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Moore M.;

 through a linker to a solid phase, forming a complex of (A)-solid phase.

through a linker to a solid phase, forming a complex of (A)-solid phase.

where (A) comprises 10-50 annino acids capable of forming a secondary

structure in a benign buffer after liberation from the solid phase, and

further the (A)-solid phase complex comprises an immunogenic substance

and/or an immune mediator coupled on (A). The present sequence

represents a peptide used in an example from the present invention. An

(A)-solid phase complex can be used as a scaffold for the production of

chemical derivatives, characterised by covalently attaching molecules at

attachment points. Alternatively (A) is used as a scaffold-peptide for

the incorporation into an Immunostimulating Complex (Iscom) resulting an

(A)-iscom complex which is used for the chemical coupling of antigenic

substances in an aqueous solution by conjugation. (A) derivatised with

one or more peptides having fibronectin-, laminin- or vitronectin-like

binding activities can be used for the promotion of cell-attachment to

plastic surfaces, in particular to inhibit tumour growth and metastasis,

and for promotion of wound healing. Also a derivatised (A) can be used

for the selection of specifically-binding aptamers or as a diagnostic agent. Such diagnostic.(A) molecules could be used to detect molecules derived from or indicative of pregnancy or of a disease, such as an infectious, autoimmue or cancerous disease.
 Synthetic DNA coding for the wild-type universal Th epitope from tetanus toxoid, designated TT830, was fused to the 3'-end of DNA encoding heavy chain sequences from the humanised anti-Fc gamma RI monocional antibody H22. The resulting fusion protein was shown to be significantly more efficient in antigen presentation and T cell stimulation that the TT830 epitope alone. A similar fusion construct was prepared coding for a mutant, antigonistic form of the epitope (designated TT83S) fused to the anti-Fc gamma RI. The Fab22-TT833S is at least 100 times more effective than TT833S in inhibiting T cell activation.

tetanus toxin. They are used to enhance host immune response to vaccines. The specification describes a Plasmodium yoelil liver stage protein designated PyHEP17. This protein elicits a response is rate protein designated PyHEP17. This protein elicits a response is (NYLS3). This antibody does not recognise sporozoites, but does recognise P. yoelil liver stage parasites. NYLS3 eliminates upto 90% of liver stage parasites. The specification describes a vaccine for reducing the severity or incidence of infection by a malaria parasite of the genus Plasmodium. The DNA vaccine comprises exon 1 and part of exon 2 of the PyHEP17 gene.
 Plasmodium species - comprises a first nucleic acid encoding a first polypeptide capable of eliciting an immune reaction against an antigen expressed during the liver

The patent discloses new covalently reactive antigen analogs (CRAA)

Co formula XI-Y-E-X2, in which XI and X2 represent peptide sequences

Co of an epitope of a disease-associated protein, Y is a positively

charged amino acid residue, preferably Lys or Arg, and E is an

electrophilic reaction centre preferably Lys or Arg, and E is an

considery. Dependending on the identity of the epitope, the CRAA may be used

to stimulate production of catalytic antibodies specific for

predetermined antigens associated with particular medical disorders.

CT They may also be used to permanently inactivate endogenously produced

catalytic antibodies produced in certain autoimmune diseases as well as

C Annospt the specifically exemplified CRAAs is one based on residues

421-436 of a B-cell epitope of gpl20 (see AAY04046) which may be used

to counter HIV-1 infections. When used as an immunogen, preferably this

CRAA is conjugated at its N-terminal to a T-helper epitope and

toxoid. The present sequence represents the T-helper epitope and

The invention relates to the manufacture of a synthetic chimeric peptide comprising a non-typable Haemophilus influenzae fimbrin peptide fused via a linker peptide to a T-cell epitope peptide. The chimeric peptide is used in immunogenic compositions which induce an immune response against non-typable Haemophilus influenzae. This sequence represents an example of a T-cell epitope peptide used to generate the chimeric peptide.
 Multispecific single chain antibody; antibody H22; tumour cell; therapy; antibody-dependent cellular cytotoxicity; ADCC; HER 2/neu; infection; epidermal growth factor receptor; breast cancer; ovarian cancer.

antibody-dependent cellular cytotoxicity (ADCC) against a tumour cell which is characterised by overexpression of HER 2/neu or epidermal growth factor receptor (EGER), comprises contacting the tumour cell with a multispecific protein molecule (preferably a single chain antibody) comprising: (a) an anti-Fc receptor antibody or an antigen binding fragment; (b) a portion which binds to HER 2/neu; and (c) a portion which binds to EGFR. The method can be used for treating cancers especially breast cancer or ovarian cancer. The multispecific antibody can also be administered prophylactically to vaccinate a subject against infection
 The present invention is concerned with methods of treating asthma, eosinophilia, allergic rhinitis and other allergic diseases. These involve the use of interleukin-5 (IL-5) analogues and modified IL-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition, it is possible that they may be used in the treatment of cancer and

treatment of allergy. The compound (I) for the prevention and/or treatment of allergy. The compound comprises at least one allergen antigenic determinant (i) recognised by a B cell or an antibody secreted by a B cell of a non-atopic individual and at least one antigenic determinant (ii) different from the allergen that triggers T cell activation. (I) has antiallergic, antiathmatic, antinflammatory. dermatchogical and immunosuppressive activities, and can be used in a vaccine. (I) may be used in a pharmaceutical or cosmetic medicament to treat and/or prevent allergies or a disease of allergic origin, especially hypersensitivities. These include rhinitis, sinusitis, concornial asthma, atopic dermatitis, some forms of acute and chronic urticaria, gastro-intestinal syndromes associated with the ingestion of cod allergens, oro-pharyngal syndrome, anaphylactic reactions associated with drug hypersensitivities and/or a mixture of these. The use of (I) in the treatment of allergic conditions avoids the need for drug treatment, which often causes undesirable side-effects. Also, prior art drug theraples alleviate symptoms, but do not influence their causes, however (I) actually combats the cause of an allergic reaction. The present sequence represents a peptide, which is used in an example from the present invention.
 ö

used to create a fusion protein with murine osteoprotegerin ligand (OPGL). Osteoprotegerin is a secreted member of the tumour necrosis dependent manner. The OPGL protein is synthesised as a type II actor receptor family, which blocks osteoclastogenesis in a dose dependent manner. The OPGL protein is synthesised as a type II transmembrane protein. The murine and human OPGL polypeptides are 87% homologous. OPGL is a potent osteoclast differentiation factor when combined with CSF-1. It is not capable of inducing osteoclast differentiation in the absence of CSF-1. OPGL is also an activator of down-regulation of OPGL activity in an animal. The method for the in vivo down-regulation of OPGL activity in an animal. The method comprises using at least one OPGL polypeptide or subsequence, and/or at least one OPGL polypeptide or subsequence, and/or at least one OPGL polypeptide are useful for treating, preventing and ameliorating osteoprosis or other diseases or conditions characterised by excessive

Tetanus toxoid protein derived T-cell activating epitope P2.

```
The present sequence is the tetanus toxoid T-cell epitope P589, derived from Clostridium tetani. It is used in the construction of recombinant protein CDC/NIIMALVAC-1, which is a multivalent, multistage malarial vaccine. The recombinant protein comprises, melittin signal peptide, (H18)6 tag, T-cell epitope from tetanus toxoid and 21 antigenic epitopes from circumsporozoite protein. 2 (H28)7, sporozoite surface protein-2 (MSP-1), MSP-2, apical membrane antigen-1 (MAP-1), erythrocyte binding antigen-175 (EBA-175). Thoptry associated protein-1 (RAP-1) and gamete specific antigen, Pfg77. These epitopes were obtained at different stages of the life cycle of P. falciparum. CDC/NIIMALVAC-1 vaccine has malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for detecting P. falciparum in biological samples.

which is produced by Caulobacter and consists of Caulobacter surface layer (S-layer) protein (containing the C-terminal secretion signal) and a target protein heterologous to Caulobacter. The cleavage of target protein from the S-layer protein is caracter. The cleavage of target protein from the S-layer protein is caracter. The cleavage of target conditions so that cleavage occurs at aspartate-prolline dipeptide site without solubilising the protein. The cleavage is accomplished while the fusion protein is in an insoluble aggragate form which facilitates purification of the protein. The method is useful for producing pure proteins including recombinant human and animal therapeutic antibiotic and vaccine peptides, enzymes, protein polymers, and antibacterial enzymes for foodstuffs.

The present sequence is a T-cell activating epitope P2 derived from tetanus toxold protein. This sequence was fused to a DNA encoding a fragment of Infectious pancreatic necrosis virus surface glycoprotein which is a vaccine candidate. This chimeric protein was in turn fused to DNA encoding C crescentus S-layer secretion signal (corresponds to the C-terminal portion of the S-layer protein from amino acid 690 onwards and contains native Asp-Pro site) for construction of a recombinant construct which is expressed in Caulobacter and then cleaved

The invention relates to a new method for inducing killing of a tumor cell which expresses HER 2/neu or epidermal growth factor receptor feGFR). The method comprises contacting the tumor cell with a multispecific protein comprising a component, preferably an antibody, which binds to an Fc receptor (FCR), Her 2/neu or EGFR. The method is useful for inducing killing of a tumor cell from breast cancer, sarcoma, carcinoma, or ovarian cancer. Specific multispecific proteins can also be administered to a subject to treat or prevent other diseases or conditions, including pathogenic infections (e.g., viral (such as HIV)), protozoan infections (such as Toxoplasma gondii), fungal infections (such as candidiasis), and an autoimmunity (e.g. immune thrombocytopenia purpura and systemic lupus). The present sequence represents a wild-type tetanus toxin TT830 epitope.

 NAT. STRUCT. BIO1. 4:788-792(1997).

-1- FUNCTION: TETANUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
WHERE IT CAM MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
ENDOPERTIDASE THAT CATALYZES THE HYDROLYSIS OF THE 76-GLN-|-PHE-777
 SUBUNT: THE PRECURSOR POLYPEPTIDE IS SUBSEQUENTLY CLEAVED TO YIELD SUBCHAINS L AND H. THESE REMAIN LINKED BY A DISULFIDE BRIDGE AND ARE NON-TOXIC AFTER SEPARATION.
MISCELLANEOUS: THE C-TERMINAL OF THE HEAVY CHAIN BINDS TO
 GANGLIOSIDE RECEPPORS.
SIMILARITY: BELONGS TO PEPTIDASE FAMILY M27 (ZINC
METALLOPROTEASE); ALSO KNOWN AS THE TETANUS/BOTULINUM NEUROTOXIN
 Hydrolase; Metalloprotease; Zinc; Plasmid;
 Umland T.C., Wingert L.M., Swaminathan S., Furey W.F., Schmidt J.J., Sax M.;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
